EXPERIENCE

Freelance Developer — online shop with automatic service delivery **07/2023 – now**

- Built an online shop with **PHP 8, MySQL, Bootstrap and REST APIs**. It serves **200 customers** and **50 orders** every month.
- Wrote a system that **sets up and sends the service to the customer right after they pay**. Nobody has to do it by hand.
- Connected a payment gateway. Payments are matched to orders in real time. I also built sales reports for the client.
- Run **Linux servers** in several regions at **99%** uptime. I fix problems and bring the service back myself.

Technical Support Associate — Z1 Computer JSC **09/2025 – 10/2025**

- Fixed hardware and software problems, so the office lost less time. Looked after the company website. Used AI tools to make internal work faster.

SELECTED PROJECTS

ATS Scan — open-source tool: reads a CV, scores a job post **10/2026**

- A web app that runs **only inside the browser**. It reads a CV in **PDF or DOCX**, compares it with a job post, gives a score, and shows why a CV filter (ATS) may fail to read the file.
- Plain **JavaScript**, no framework. The scoring engine is separate from the page, so I can test it with `node --test` (31 tests). A **CSP** rule stops the page from sending data anywhere. github.com/nguyenquocanhz/cv

Small tools I wrote — Python, PowerShell, Node.js, open source **2025 – 2026**

- **pulse** checks if services are up and shows a status page · **DomainGateway** tracks when domains expire · **sshvault** keeps SSH keys encrypted · **BootReport-Health** reads disk health and battery wear from a laptop. github.com/nguyenquocanhz

RapPhim WareHouse — one REST API used by three clients **09/2026**

- I designed the **API first**: clear endpoint names, one response shape, one set of error codes. Then the web, Android and iOS clients all used the same API, and I did not have to change the server.
- Built with **Spring Boot 4.1 and Java 17**. It caches data, checks input, and writes its own **OpenAPI** docs. Packed with **Docker**, built by **GitHub Actions**. github.com/nguyenquocanhz/RapPhimWareHouse

SKILLS

Languages	**Python**, JavaScript / TypeScript, Java, PHP, SQL, Go, C++
AI & LLM	**Claude Code**, **Antigravity** — I write **prompts**, give the work to the agent, then test the result. I used AI tools to speed up office work at Z1 · **RAG**, **chatbot** **[done any yet?]**
Automation	A system that **sends the service right after payment**; Python / PowerShell / Bash scripts on a schedule; webhooks, cron jobs, a Telegram alert bot; **n8n** **[how much?]**
Data pipeline & documents	**Read text out of PDF and DOCX files** and turn it into clean data; a **pipeline** that collects → removes duplicates → scores; **31 tests** that check how well the scoring engine works (evaluation)
Service / API	**REST API** with 32 endpoints, **OpenAPI / Swagger** docs written by the code, input checks, caching; connected payment and third-party APIs to a website and to a **customer and order system (CRM)** I built
Data & Cloud	**SQL Server**, **MySQL 8** — database design (ERD), stored procedures, indexes, faster queries; Cloudflare R2
Monitoring & DevOps	**pulse** — system monitoring with a status page and alerts; client servers at **99%** uptime · **Docker**, Docker Compose, **Git / GitHub**, Git Flow, GitLab CI/CD, Linux
Writing & teamwork	Wrote a **56-page technical handbook** (IEEE Std 1063-2001) and API docs · **team leader for 5 people** on two projects · I learn fast and I like solving real problems

EDUCATION & CERTIFICATION

HCMC College of Economics and Technology (HOTEC) — Information Technology (Software) **08/2023 – 03/2026**

Full-time · GPA **3.65 / 4.0** · graduated with **Excellent** rank · TOEIC 575 (07/2024) — I read English technical documents every day; my speaking is still basic and I am working on it

SUMMARY

I finished my IT degree in March 2026 with an **Excellent** rank, and I have built real products for three years. Most of my work is **automation**: a system that sends a service to the customer right after they pay, **Python** scripts that collect, clean and score data, a tool that reads **PDF and DOCX** files, and a service that watches servers and sends alerts. I use **AI agents (Claude Code, Antigravity)** every day at work. I want to learn **RAG, chatbots and LLMs** on a real product.
