EDUCATION & CERTIFICATION

HCMC College of Economics and Technology (HOTEC) — Information Technology (Software) **08/2023 – 03/2026**
Full-time · GPA **3.65 / 4.0** · graduated with **Excellent** rank · TOEIC 575 (07/2024)

SELECTED PROJECTS

Domain Gateway — one dashboard for every domain expiry date, open source **2026**

- A **Python** web app (~4,300 lines) that keeps every domain in one place, whoever you bought it from. It reads the expiry date **straight from the registry**, so it needs no API key from any provider.
- Each domain goes down a **chain of sources** and stops at the first one that answers: **RDAP → WHOIS port 43 → BKNS** for `.vn` names, which have no public RDAP. Answers are cached for 12 hours, and a **Telegram alert** goes out before a domain expires. Runs in **Docker**, built by **GitHub Actions**. github.com/nguyenquocanhz/DomainGateway

BootReport-Health — one-line health check for a laptop, open source **10/2026**

- Runs with **one command** and reads what the machine already knows: boot time and what slows it down, **battery wear** and charge cycles, **SMART** data from the SSD/NVMe, and the **blue screen (BSOD)** history. It writes an HTML report in Vietnamese and English.
- **PowerShell** for Windows and **POSIX shell** for Linux, macOS and Android (Termux). It only reads. It never changes the machine and never sends data anywhere. github.com/nguyenquocanhz/BootReport-Health

RapPhim WareHouse — one REST API used by three clients **09/2026**

- I designed the **API first**: clear endpoint names, one response shape, one set of error codes. Then the web, Android and iOS clients all used it without any change to the server.
- Built with **Spring Boot 4.1 and Java 17**. It caches data, checks input, and writes its own **OpenAPI** docs. Packed with **Docker**, built by **GitHub Actions**. github.com/nguyenquocanhz/RapPhimWareHouse

SKILLS

Languages	**Python**, JavaScript / TypeScript, Java, PHP, SQL, Go, C++
AI & LLM	**Claude Code**, **Claude Cowork**, **Antigravity** — I write **prompts**, give the work to the agent, then test the result. I used AI tools to speed up office work at Z1 · **RAG**, **chatbot** **[done any yet?]**
Automation	Services that **run on their own** on a schedule — Python / PowerShell / Bash, webhooks, cron jobs, a Telegram alert bot; **n8n** **[how much?]**
Data pipeline	A **pipeline** that collects → cleans → scores, with a **chain of fallback sources** and a cache; I also read text out of **PDF and DOCX** files and turn it into clean data
Service / API	**REST API** with 32 endpoints, **OpenAPI / Swagger** docs written by the code, input checks, caching; connected payment and third-party APIs to a website and a **CRM**
Data & Cloud	**SQL Server**, **MySQL 8** — database design (ERD), stored procedures, indexes, faster queries; Cloudflare R2
Monitoring & DevOps	**pulse** — system monitoring with a status page and alerts; client servers at **99%** uptime · **Docker**, **Git / GitHub**, Git Flow, GitLab CI/CD, Linux
Writing & teamwork	Wrote a **56-page technical handbook** (IEEE Std 1063-2001) · **team leader for 5 people** · proactive, willing to learn, good at problem solving

EXPERIENCE

Freelance Developer — **Ptcloud.net**, online service shop with automatic delivery **07/2023 – now**

- Built the shop with **PHP 8, MySQL, Bootstrap and REST APIs**. It serves **200 customers** and **50 orders** every month.
- Wrote a system that **sets up and sends the service to the customer right after they pay**. Nobody has to do it by hand.
- Connected a payment gateway. Payments are matched to orders in real time. I also built sales reports for the client.
- Run **Linux servers** in several regions at **99%** uptime. I fix problems and bring the service back myself.

Technical Support Associate — Z1 Computer JSC **09/2025 – 10/2025**

- Fixed hardware and software problems, so the office lost less time. Looked after the company website. Used AI tools to make internal work faster.
